I decided on my design by thinking about it in a simplistic way. I did not want anything flashy or difficult given that this is only one of the few times that I have been on d3 or anything associated with it. When I do visualization, I use Tableau or even Google Sheets to create my visualization because I feel that those are better suited for me personally. I did not really sketch out what I wanted because I wanted that simplicity and familiarity when designing this. I was already frustrated enough with using d3 as it is just something that I am not used to using. I chose relatively basic colors as when you click on one or even hover over it yellow sticks out. This way you do not get confused with which one you are looking at as there are more than 2 or 3 different car brands. I was wondering about the popularity of the various car brands that are very present in the North American market as I see them every single day driving. I see, at least in my area, Honda's everywhere I drive yet when I look at the graph it is less than Toyota's. This is a shock because I do not see as many Toyotas but maybe I am not paying that close attention to it.
